Abstracts

Frit is a ceramic composition formed by fusing inorganic materials into a glass by heating them in smelters and quenching them in water. Frits are the main component of nearly all ceramic glazes and are present in many compositions of different materials where a glass face is needed, even if only as a binder. The multiple applications, and various baking methods of the products which are used, under different names, have made it so that over the years the Frits family has gained numerous members, many of them very different between themselves.
