Abstracts

According to our (Global Info Research) latest study, the global Ceramic Heating Element for Laser Printer Fuser market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

As we all know, laser printer printing needs to go through charging, exposure, transfer, and finally fix the image on the medium. At present, thermal fixing is generally used. The fuser, also known as the heating unit, the printed medium that has been transferred passes through the slit between the upper and lower rollers of the heating unit, and under high temperature and pressure, the developer is melted and penetrated into the paper fiber, which realizes fixing. According to the form of the heater, there are three main types of heating components: ceramic heating, lamp heating, and electromagnetic induction heating. But no matter what kind of heating, the temperature control is through the thermal sensor to sense the temperature change, and the fixing temperature is controlled through the IC circuit. In order to shorten the warm-up time of laser printers under the condition of energy saving, ceramic sheet directional heaters were introduced later. Different from the traditional fixing roller heating method, the upper roller assembly of the ceramic directional heating method uses a thin film (fixing film) with a thickness of less than 0.1mm to replace the original aluminum-based upper roller, and its rotation is also obtained by the friction of the lower roller. Advantages such as length. Ceramic chip heaters consist of a high thermal conductivity ceramic substrate with a heating circuit printed on it and a protective glass glaze. Some laser printers also solidify the thermal sensing element on the ceramic heater, such as HP6L and so on.
