According to our (Global Info Research) latest study, the global Ceramic Target market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Ceramic targets are relatively brittle targets, and usually, ceramic targets are bound with a backing plate. In addition to supporting the ceramic target during the sputtering process, the backing plate can also play a role in the heat transfer during the sputtering process.

Ceramic target are used in a process called Physical Vapor Deposition (PVD), which is used in the production of various thin films, including semiconductor devices, solar cells, and optical coatings. Target ceramics are made up of materials such as alumina, titanium dioxide, zirconia, and silicon dioxide. They have high melting points, low sputtering rates, and high purity, making them popular for use in PVD processes. They are also durable, chemically stable, and resistant to heat and wear, making them an ideal choice for many industrial applications.
