Abstracts

The global Ceramic Target market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Ceramic target are used in a process called Physical Vapor Deposition (PVD), which is used in the production of various thin films, including semiconductor devices, solar cells, and optical coatings. Target ceramics are made up of materials such as alumina, titanium dioxide, zirconia, and silicon dioxide. They have high melting points, low sputtering rates, and high purity, making them popular for use in PVD processes. They are also durable, chemically stable, and resistant to heat and wear, making them an ideal choice for many industrial applications.

Ceramic targets are relatively brittle targets, and usually, ceramic targets are bound with a backing plate. In addition to supporting the ceramic target during the sputtering process, the backing plate can also play a role in the heat transfer during the sputtering process.

This report studies the global Ceramic Target production, demand, key manufacturers, and key regions.
