Abstracts

According to our (Global Info Research) latest study, the global Cermet Powders market size was valued at US\$ 762 million in 2025 and is forecast to a readjusted size of US\$ 1029 million by 2032 with a CAGR of 4.4% during review period.

Cermet powders are micron- or nano-scale powder materials produced by combining metals (or alloys) with ceramics (or their compounds) through specialized processes. These powders integrate the high hardness, high-temperature resistance, and wear resistance of ceramics with the superior toughness and thermal conductivity of metals; they are primarily used in thermal spraying, additive manufacturing (3D printing), and powder metallurgy.

Upstream materials mainly consist of hard ceramic powders?such as tungsten carbide, chromium carbide, and titanium carbide?and metal binder phase materials, including cobalt, nickel, and chromium powders, as well as nickel-chromium alloy powders. Production involves processing steps such as spray granulation, sintering, crushing, screening, and plasma spheroidization. Raw material costs are significantly influenced by the prices of metals like tungsten, cobalt, nickel, and chromium; cobalt and tungsten, in particular, have the most pronounced impact on the costs of WC-Co and WC-CoCr systems. Downstream applications primarily involve wear-resistant coatings in sectors such as aerospace, energy, petrochemicals, papermaking, iron and steel, and mining machinery.

In 2025, global sales volume is approximately 9,500 tons, with an average price of around 65?90 USD/kg; major manufacturers in the industry report gross profit margins of approximately 25%?40%.
