Abstracts

The global Cermet Trimmer market size is expected to reach \$ 315 million by 2032, rising at a market growth of 5.1% CAGR during the forecast period (2026-2032).

In 2025, global cermet trimmer production reached approximately 144 m units, the average price is 1500 usd/k units. A cermet trimmer is a fine-tuning device that uses metal ceramic as its core functional material. It is mainly used in circuits where parameters need to be adjusted within a small range. By mechanically adjusting the metal-ceramic component to change its electrical characteristics, the circuit parameters can be finely adjusted and calibrated. It is commonly found in fields such as electronic instruments, communication equipment, and precision control modules where high accuracy and stability of parameters are required.

Market Concentration and Major Players:

Internationally, the market for cermet trimmer is highly concentrated, primarily in developed countries such as Europe, the US, and Japan. Large manufacturers include Vishay and Bourns. Domestically, the cermet trimmer market still has significant room for growth.

Manufacturing Process and Market Trends:

Manufacturing typically involves mixing metal and ceramic powders with a binder, granulating the mixture through ball milling, and then pressing or injection molding it into a green substrate. This is followed by high-temperature sintering to densify and bond the materials. A metal-ceramic resistive layer is then formed on a ceramic substrate using thick-film printing or deposition. The resistance value is then precisely set using

laser adjustment. Finally, the sliding brush, housing, pins, and other structural components are assembled, and sealing and testing are completed.

The market is mainly driven by the high-precision calibration needs of industrial automation, communication equipment, automotive electronics and medical instruments. Products are developing towards miniaturization, multi-layering and fully sealed high-reliability structures to adapt to harsh environments such as high temperature, high humidity and vibration. At the same time, the popularization of surface mount technology is driving packaging innovation. In the future, it is also necessary to adapt to the higher requirements of high frequency and high speed circuits for low noise and high stability, and to integrate intelligent and customized production trends to meet the differences in segmented fields.
