Cervical intraepithelial neoplasia (CIN) is a disorder in which the cervix grows aberrant cells. Certain kinds of the human papillomavirus (HPV), as well as other environmental variables, can cause it, and it can sometimes lead to cervical cancer precursors. Cervical cancer is uncommon, although cervical intraepithelial neoplasia is not. The bottom section of the uterus that goes into the vaginal canal is known as the cervix. During childbirth, the cervix dilates to allow the foetus to pass through. The aberrant cells in cervical intraepithelial neoplasia aren't malignant. It can, however, grow into precancers or cancer if not monitored or treated in certain circumstances that require therapy. This condition is also termed as cervical dysplasia.
