Abstracts

The global Cesium Bromide market size is expected to reach \$ 41.22 million by 2032, rising at a market growth of 3.2% CAGR during the forecast period (2026-2032).

Cesium bromide is a hygroscopic inorganic halide composed of cesium and bromide ions and is generally supplied as a white crystalline powder. It serves as a cesium and bromide source for perovskite optoelectronic materials and CsPbBr₃ crystal growth, and is also used in scintillation and X-ray detection materials, infrared optical crystals, spectrophotometer beam splitters, and other high-purity specialty chemicals. Optical grades require substantially tighter control of purity, moisture, and trace metals than standard industrial grades. Global cesium bromide market was estimated at approximately 110 tons in 2025, with an average ex-factory price of about 295 US\$/kg.

Growth is primarily driven by the development and commercialization of perovskite solar cells, light-emitting diodes, quantum dots, photodetectors, and direct-conversion X-ray detector materials, where high-purity CsBr provides a stable source of cesium and bromide. Medical imaging, security inspection, industrial nondestructive testing, and infrared spectroscopy also support demand for scintillation and optical grades. Expansion is constrained by the concentration of global cesium resources, high purification costs, the material's hygroscopicity, and the early commercialization stage of many perovskite technologies, making high purity and batch-to-batch consistency more valuable than volume expansion alone.

This report studies the global Cesium Bromide production, demand, key manufacturers, and key regions.
