Abstracts

Chalcogenide glasses are composed of sulfur (S), selenium (Se) and tellurium (Te). And through the addition of other elements, such as arsenic, germanium and antimony, the cross-linking between sulfur chains is established to promote the formation of stable glass. Compared with silicon glass, it has many promising characteristics, such as mid far infrared transmission, low phonon energy, high refractive index and very large nonlinearity. In this paper, infrared chalcogenide glasses which can penetrate infrared light are mainly studied.

This report studies the global Chalcogenide Infrared Glass production, demand, key manufacturers, and key regions.
