Abstracts

The global Chemical Anchor Studs market size is expected to reach \$ 1334 million by 2032, rising at a market growth of 4.2% CAGR during the forecast period (2026-2032).

Chemical Anchor Studs are threaded steel studs used together with chemical anchoring adhesives, such as epoxy, vinyl ester or polyester resin, to fix structural or non-structural components into concrete, masonry, stone or other base materials. The stud is inserted into a drilled hole filled with chemical adhesive, and after curing, the adhesive bonds the stud to the base material, providing strong pull-out resistance, high load-bearing capacity and reliable anchoring performance.

In 2025, global Chemical Anchor Studs production reached approximately 303 million units, with an average global market price of around US\$ 3.2 per unit.

The upstream supply chain includes carbon steel, stainless steel, alloy steel, zinc coating materials, hot-dip galvanizing materials, threaded rod processing, nuts, washers, chemical resin cartridges, glass capsules, packaging materials and testing equipment. Downstream demand mainly comes from construction, infrastructure, bridge engineering, tunnel engineering, curtain wall installation, steel structure fixing, equipment installation, rail transit, power facilities and industrial plant construction.

The cost structure mainly includes steel raw materials, threading and cutting, surface treatment, nuts and washers, chemical adhesive matching, quality testing, packaging, logistics, labor, equipment depreciation, certification, warranty and after-sales service. Steel material and surface treatment usually account for the main cost share, while stainless steel, high-strength grades and certified anchoring systems have higher production costs.

This report studies the global Chemical Anchor Studs production, demand, key manufacturers, and key regions.
