According to our (Global Info Research) latest study, the global Chemical Battery market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

A chemical battery is a device that converts chemical energy into electrical energy. The main part includes the electrolyte solution and the positive and negative electrodes immersed in the solution. When in use, connect the wires to the two electrodes, that is, a current passes through (discharge), thus obtaining electric energy. After discharge to a certain extent, the electric energy weakens, and some can be recharged and restored to use again, called storage batteries, such as lead storage batteries, iron-nickel storage batteries, etc., and some cannot be charged and restored, called primary batteries, such as dry batteries, Daniel batteries, fuel cells, etc.

According to data released by the China Association of Automobile Manufacturers, in December 2022, the production and sales of hydrogen fuel cell vehicles in China was 653 and 607, respectively. In the whole year of 2022, the production and sales of hydrogen fuel cell vehicles was 3,626 and 3,367, a year-on-year increase of 105.4% and 112.8%, respectively. According to our Fuel Cell Research Center, by the end of 2022, the number of fuel cell vehicles in the world had reached 67,000 units, a year-on-year increase of 36.6%. Among them, the number of fuel cell vehicles in China was 12,682 units.
