## Abstracts

According to our (Global Info Research) latest study, the global Chemical Grouts market size was valued at US\$ 2799 million in 2025 and is forecast to a readjusted size of US\$ 3707 million by 2032 with a CAGR of 4.2% during review period.

Chemical grouts refer to non-cementitious, liquid grouting systems based on reactive or gelling chemistries, which are injected into cracks, voids, or porous media and subsequently undergo polymerization, crosslinking, or gelation to provide water sealing, ground stabilization, or void filling. Typical chemistries include polyurethane, acrylate, epoxy, and silicate grouts, characterized by adjustable viscosity, high penetrability, and controllable reaction times, making them suitable for underground works, tunneling, excavation support, and structural repair applications where rapid sealing and precision grouting are required. In 2025, global chemical grouts sales is about 8,000 kilotons/year, with an average ex-works price of roughly US\$900/ton, with installed capacity around 12,000 kilotons/year and a typical materials gross margin of 18%–28%.

The chemical grouts industry chain consists of upstream chemical feedstocks and resin monomers (such as polyols, isocyanates, acrylate monomers, epoxy resins and additives), midstream formulation, modification and manufacturing of chemical grouting materials, and downstream demand from infrastructure, underground engineering, construction, and industrial sectors for water sealing, seepage control, and ground stabilization.
