Abstracts

According to our latest research, the global Chemical Mechanical Polishing Service market size will reach USD 9874 million in 2031, growing at a CAGR of 7.2% over the analysis period.

Chemical Mechanical Polishing (CMP) service is a surface flattening technology that combines chemical etching with mechanical grinding. It is widely used in fields that require extremely high surface flatness, such as semiconductor manufacturing, optical component processing, and hard disk head preparation. In the CMP service, the chemically active components in the polishing liquid react with the surface of the processed material to generate a relatively soft reaction product layer, which is then removed by the mechanical friction between the polishing pad and the surface of the processed material. This cycle is repeated to achieve layer-by-layer removal and flattening of the material surface. The key to this service is to accurately control the balance between the chemical etching rate and the mechanical grinding rate to ensure that a highly flat and damage-free surface is obtained while removing excess material, meeting the strict requirements of subsequent processes for surface morphology and roughness, and providing a basic guarantee for the manufacture of high-performance devices.

As a core technology in semiconductor manufacturing, optical component processing, advanced packaging and other fields, Chemical Mechanical Polishing (CMP) has shown a rapid development trend in recent years. In the semiconductor field, as the chip process advances to 3nm and below nodes, CMP technology has become a key process for achieving global wafer flatness, which directly affects chip yield and performance. At present, the global CMP service market is dominated by international

giants such as Applied Materials and Ebara of Japan, but domestic companies such as Huahai Qingke have achieved domestic substitution of CMP equipment and services for 28nm and above processes through technological breakthroughs and capacity expansion, and accelerated penetration into 14nm and below advanced processes.
