The global Chemical Milling market size is expected to reach \$ 243 million by 2032, rising at a market growth of 3.7% CAGR during the forecast period (2026-2032).

Chemical milling or industrial etching is the subtractive manufacturing process of using baths of temperature-regulated etching chemicals to remove material to create an object with the desired shape. It is mostly used on metals, though other materials are increasingly important.

Photochemical machining (PCM), also known as photochemical milling or photo etching, is a chemical milling process used to fabricate sheet metal components using a photoresist and etchants to corrosively machine away selected areas. This process emerged in the 1960s as an offshoot of the printed circuit board industry.

Americas is the largest producer of Chemical Milling, with a market share about 45%, followed by APAC and Europe, etc. United Western Enterprises, VACCO Industries, Advanced Chemical Etching, PCM Products Inc and Tech-Etch are the top 5 manufacturers of industry, and they had about 30% combined market share.
