## Abstracts

Chemical organic UV filters, also known as organic sunscreen filters or simply chemical UV filters, are compounds used in skincare products to shield the skin from the harmful effects of ultraviolet (UV) radiation emitted by the sun. Unlike physical UV filters, which create a barrier on the skin's surface to reflect and scatter UV rays, chemical organic UV filters function by absorbing UV radiation and converting it into less harmful forms of energy, such as heat or infrared radiation. These filters typically consist of organic compounds with conjugated double bonds or aromatic rings, which enable them to effectively absorb UV radiation. Examples of chemical organic UV filters include avobenzene, oxybenzone, octocrylene, and octinoxate. Chemical organic UV filters are often included in sunscreen formulations to enhance their ability to block both UVA and UVB rays. They are preferred by some individuals for their lightweight and transparent nature, which allows for easier application without leaving a noticeable residue on the skin.

According to our (Global Info Research) latest study, the global Chemical Organic UV Filter market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.
