Abstracts

According to our (Global Info Research) latest study, the global Chemical Peptizer market size was valued at US\$ 228 million in 2025 and is forecast to a readjusted size of US\$ 311 million by 2032 with a CAGR of 4.5% during review period.

In 2025, the global production of chemical peptizers was approximately 56,000 tons, with an average selling price of around US\$3,960 per ton. Single-line production capacity is approximately 1,000-3,000 tons per year, with an average gross profit margin of about 20-30%. Chemical peptizers are processing aids that promote the breaking of raw rubber molecular chains through chemical reactions (such as free radical chain reactions), thereby reducing rubber viscosity, enhancing plasticization effects, shortening processing time, and saving energy. They primarily function in the initial stages of rubber processing, making the raw rubber soft and easy to shape without negatively affecting the performance of the vulcanized rubber products.

The upstream raw materials for chemical peptizers mainly include basic chemical raw materials such as benzene, toluene, sulfur, thiophenol, and fatty alcohols used to synthesize core active ingredients, as well as inorganic and organic additives such as zinc oxide and fatty acids used for modification and catalysis. Their downstream applications are directly in industries with core demands for rubber processing performance, primarily the tire manufacturing industry, followed by various industrial rubber products, footwear materials, and recycled rubber production. Their demand is closely linked to the development of the global automotive industry, infrastructure construction, and resource recycling industries.
