Abstracts

Chemical vapor deposition is a chemical progression utilized for the production of high performance high purity solid materials. It includes a deposition process of a high performance thin solid coating, fibers, powders and monolithic components over metal or plastic surfaces of numerous products. There are many precursors/materials that are deposited in solid form on the surface and the choice of precursor depends upon the type of application for which the deposition film is made. This technology further has been categorized into plasma enhanced (PECVD), combustion (CCVD), and hot-wire chemical vapor deposition (HWCVD).

SCOPE OF THE REPORT:

This report focuses on the Chemical Vapor Deposition (CVD) in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application.

In the current scenario, industry players are focusing on developing processes for hybrid thin inorganic-organic deposition films to lower the production costs, thereby driving the semiconductor industry. This trend has led to increased and tighter supply of titanium compounds in compliance with environmental norms.

The worldwide market for Chemical Vapor Deposition (CVD) is expected to grow at a CAGR of roughly xx% over the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
