Abstracts

Chemotherapy is widely used as to target the neoplastic cells. However, this therapy is effective against most of the cancer, but the cells of the hematopoietic system that produces billions of blood cells needed daily are highly sensitive to this therapy and result in loss of blood cell population. This condition is known as the chemotherapy-induced neutropenia. In chemotherapy-induced neutropenia, the body has a low level of neutrophils which are types of white blood cells. Neutrophils are body's defense system against infections. Neutrophils fight against infection by destroying fungi, bacteria or yeast. Neutropenia occurs in about half of the people receiving chemotherapy. People with chemotherapy-induced neutropenia are most likely to develop infection and fever. It can also lead to delay in treatment and reduction in chemotherapy dose intensity. Chemotherapy-induced neutropenia is most likely to occur in cancer that directly affects the bone marrow such as leukemia. Chemotherapy-induced neutropenia patients mostly require hospitalization and cost of the treatment also increase with the anti-infective treatment.
