The chiller heat pump unit is a highly efficient cooling and heating device, widely used in air conditioning systems in commercial buildings, industrial facilities and large residential areas. It operates on the principle of reverse Carnot cycle, using core components such as compressor, evaporator, condenser and expansion valve to absorb low-grade heat energy from the environment and convert it into high-grade heat energy for heating water or generating cold air. In summer, the unit operates as a refrigeration unit, transferring indoor heat to the outdoors; in winter, the cycle is reversed, extracting heat from the outside air to provide heating for the building.
