According to our (Global Info Research) latest study, the global Chimeric Antibody market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Chimeric antibody is the first genetically engineered antibody to be produced successfully. It is made by splicing the V region gene of mouse antibody and the C region gene of human antibody into chimeric gene, and then inserting the vector, transfecting the antibody molecule expressed in myeloma tissue. Because it reduces the murine component, it reduces the adverse reactions caused by murine antibody and helps to improve the curative effect.
