Abstracts

The global Chip Burning Equipment market size is expected to reach \$ 30 million by 2030, rising at a market growth of 6.1% CAGR during the forecast period (2024-2030).

Chip burning equipment writes binary code or data into the memory cells of the chip by connecting to the target chip and using a specific programming algorithm. This can involve parallel or serial programming, depending on the chip type and device design. As chip complexity increases and production speed requirements increase, the development trend of chip burning equipment will move towards higher burning speeds to meet the needs of mass production.

Chip burning equipment is a type of special equipment used to write program code, configuration information or data into integrated circuits (ICs) or chips. This process is often called 'burning' or 'programming,' in which the device writes the required information into the chip's non-volatile memory to implement a specific function or behavior. Chip burning equipment is widely used in electronic manufacturing, research and development, maintenance and production and other fields.
