## Abstracts

The chip transformer is a miniaturized, high-performance electronic component. It uses modern electronic manufacturing technology to wind a coil on an iron core, and encapsulates the iron core and coil in a plastic shell to form a complete electrical component. This kind of transformer is usually used in power supply, communication, audio and other fields. It has the advantages of high efficiency, low magnetic leakage, strong EMI suppression capability, etc., making it more reliable and economical than traditional large transformers. The working principle of the chip transformer is similar to other transformers. When the alternating current passes through the input coil, a magnetic field is generated on the iron core and an electromotive force is induced in the output coil, thereby determining the output voltage.

According to our (Global Info Research) latest study, the global Chip Transformer market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
