Abstracts

According to our (Global Info Research) latest study, the global Chiplet Interconnect Controller Chip market size was valued at US\$ 1080 million in 2025 and is forecast to a readjusted size of US\$ 7795 million by 2032 with a CAGR of 30.3% during review period.

Chiplet Interconnect Controller Chip is a controller or interface block that manages high-speed data transfer between chiplets inside an advanced package. It supports die-to-die links, protocol conversion, physical-layer signaling and system coherency for heterogeneous processors and custom ASICs. In 2025, global Chiplet Interconnect Controller Chip production reached approximately 12,000 K units.

Chiplet adoption is accelerating because monolithic die scaling is becoming more expensive and less flexible. AI accelerators, CPUs and networking ASICs increasingly split compute, I/O, memory and analog functions into separate chiplets to improve yield and design reuse.

Interconnect controllers are valuable because they determine latency, bandwidth, energy per bit and interoperability inside the package. UCIe and other die-to-die standards are reducing ecosystem fragmentation, but many high-volume products still use optimized proprietary links.

The market remains closely tied to advanced packaging capacity and custom silicon programs. Growth will be strongest in AI and data-center processors, while broader adoption in consumer and automotive chips will depend on packaging cost reduction and standardized chiplet ecosystems.
