Abstracts

The global Chiplet Interconnect Controller Chip market size is expected to reach \$ 7795 million by 2032, rising at a market growth of 30.3% CAGR during the forecast period (2026-2032).

Chiplet Interconnect Controller Chip is a controller or interface block that manages high-speed data transfer between chiplets inside an advanced package. It supports die-to-die links, protocol conversion, physical-layer signaling and system coherency for heterogeneous processors and custom ASICs. In 2025, global Chiplet Interconnect Controller Chip production reached approximately 12,000 K units.

Chiplet adoption is accelerating because monolithic die scaling is becoming more expensive and less flexible. AI accelerators, CPUs and networking ASICs increasingly split compute, I/O, memory and analog functions into separate chiplets to improve yield and design reuse.

Interconnect controllers are valuable because they determine latency, bandwidth, energy per bit and interoperability inside the package. UCle and other die-to-die standards are reducing ecosystem fragmentation, but many high-volume products still use optimized proprietary links.

The market remains closely tied to advanced packaging capacity and custom silicon programs. Growth will be strongest in AI and data-center processors, while broader adoption in consumer and automotive chips will depend on packaging cost reduction and standardized chiplet ecosystems.

This report studies the global Chiplet Interconnect Controller Chip production, demand,
