According to our (Global Info Research) latest study, the global Chiral Column Chromatography System market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Chiral compounds are optically active and enable to rotate the polarized light to the right or to the left depending on the configuration of sample molecule. These compounds have identical physical properties. Chiral column chromatography system is primarily used for the separation and purification of optically active chiral compound. Chiral column chromatography is a laboratory technique that comprises single enantiomer of chiral compound as stationary phase and chiral selector as a mobile phase. The stationary phase of chiral column chromatography is prepared by attaching chiral compound to the suitable achiral support such as silica gel and others which makes chiral stationary phase (CSP). This chromatography system is used for the synthesis of enantiopure compounds (mirror image of the compound) in the pharmaceutical industries. Detectors such as polarimeter, optical rotary dispersion and circular dichroism are used in chiral column chromatography system.

Geographically, North America is considered as the largest market of chiral column chromatography owing to increasing investment by key companies such as Sigma-Aldrich Corporation LLC and others to develop chromatography field in North America. In addition, growing demand of green technologies coupled with technological advancements has created new end-users in petrochemical and life sciences for chiral column chromatography which would further act as the driving factor for the growth of chiral column chromatography market. Europe is considered as the second largest market of chiral column chromatography.
