## Abstracts

According to our (Global Info Research) latest study, the global Chiral Ligand market size was valued at US\$ 650 million in 2025 and is forecast to a readjusted size of US\$ 1433 million by 2032 with a CAGR of 11.9% during review period.

Chiral ligands are organic molecules that coordinate with transition metal centers to create a chiral catalytic environment, governing stereoselectivity through steric and electronic effects; while not catalytically active themselves, they are the key functional component in homogeneous asymmetric catalysis, particularly in asymmetric hydrogenation and coupling reactions, determining enantioselectivity and reaction pathways. The global chiral ligands market is estimated at USD 631 million in 2025, corresponding to a shipment volume of around 200 tons and a nominal capacity of about 320 tons, with a CAGR of approximately 12.2%.

Chiral ligands are organic molecules that coordinate with transition metal centers to create chiral catalytic environments and determine enantioselectivity in asymmetric reactions, mainly comprising phosphine ligands, P,N ligands, and N,N ligands, with diphosphine systems accounting for about 50% of market value, P,N ligands 28%, and N,N and others 22%. Pricing shows structural differentiation, with diphosphine ligands averaging around \$6,800/kg, P,N ligands about \$5,200/kg, and N,N and other ligands about \$3,200/kg, resulting in an overall blended gross margin of roughly 60%. Demand is highly concentrated in pharmaceuticals, where innovative drug synthesis and CDMO process development contribute about 70%, generic intermediates around 20%, and agrochemicals plus fine chemicals about 10%, making it fundamentally a tool-molecule market for asymmetric synthesis in pharma. The upstream consists of chiral building blocks and phosphorus fine chemicals, the midstream focuses on high-barrier ligand design and synthesis, and downstream integration occurs within pharmaceutical and

CDMO process systems. The global industry structure features a combination of technology oligopolies and catalog suppliers, with Johnson Matthey and BASF leading catalyst systems, Takasago and Solvias controlling core ligand technologies, and Merck and TCI providing standard offerings. Overall, the industry is transitioning from maturity to a technology-driven evolution phase, with growth driven by increasing molecular complexity in innovative drugs and deeper CDMO outsourcing, while uncertainty stems from substitution pressure by biocatalysis on certain metal–ligand systems.
