## Abstracts

According to our (Global Info Research) latest study, the global Chiral Organocatalysts market size was valued at US\$ 262 million in 2025 and is forecast to a readjusted size of US\$ 412 million by 2032 with a CAGR of 6.6% during review period.

The chiral organocatalyst market refers to a product-based segment consisting of metal-free small organic molecules used as catalysts to enable enantioselective transformations, typically via covalent or non-covalent activation mechanisms. These catalysts are widely applied in pharmaceuticals, fine chemicals, and agrochemicals for chiral synthesis. Key categories include proline derivatives, chiral amines, chiral phosphoric acids (CPA), and hydrogen-bonding catalysts (e.g., thioureas). This is a functional catalyst product market, excluding service or CDMO revenues.

Pricing is highly polarized: standard phase-transfer catalysts (PTCs) range from USD 200–2,000/kg, while high-end chiral phosphoric acids (CPAs) and proline derivatives range from USD 5,000–50,000/kg, with custom catalysts priced higher but contributing limited volume. Blended gross margins are estimated at 40–60%, driven by specialty chemical and reagent-like characteristics. Demand is led by pharmaceuticals (55%), followed by agrochemicals (25%, dominated by PTC applications) and fine chemicals (18%). The value chain includes upstream chiral amines, amino acids, and phosphorus intermediates, midstream catalyst design and manufacturing, and downstream API and agrochemical synthesis. The competitive landscape exhibits a “fragmented reagent-led supply vs. concentrated industrial consumption” structure, where catalog suppliers (e.g., Sigma-Aldrich, TCI) dominate sales channels, while actual industrial usage is largely internalized by players such as BASF, Evonik, and major CDMOs. Structurally, the market is in an early mature stage, with established chemistry but limited industrial

penetration, driven by metal-free and mild reaction requirements, while the key uncertainty lies in whether improvements in immobilization and catalytic efficiency can overcome economic disadvantages relative to biocatalysis and metal catalysis.
