According to our (Global Info Research) latest study, the global Chondrodite market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Chondrodite is a rare nesosilicate mineral which is usually encountered as the most frequent member of the humite group of minerals. It is formed from locally metamorphosed dolomite in hydrothermal deposits as well as associated with serpentinite and skarn. Chondrodite is found significantly in metamorphic contact zones between alkaline or acidic intrusions and carbonate rocks where the introduction of fluorine occurs by metasomatic processes. Chondrodite is produced by hydrating olivine ((Mg,Fe²⁺)₂SiO₄) and is stable over a range of pressures and temperatures which include those present in a portion of the uppermost mantle. Certain types of chondrodite such as titanian chondrodite have been found in olivine as inclusions in West Greenland. It is associated with magnetite, magnesite, olivine, clinohumite, and Ni-Co-Pb sulfides in a matrix of antigorite.

The global market for chondrodite has been witnessing average growth over the past few years. Key manufacturers involved in the industry are increasingly globalizing their business portfolio, with a number of acquisitions and mergers occurring in recent years.
