## **Abstracts**

Chondrosarcoma refers to cancer of cartilage, a flexible connective tissue found in joints between bones, the ear, the rib cage etc. According to Cancer Network Journal, chondrosarcoma contributes to almost half of the osteosarcoma cases and is the second most common type of osteosarcoma (tumor of bones). Chondrosarcoma can start at any age but most commonly found in adults above the age of 20 years. As per the statistics of American Cancer Society, occurrence of chondrosarcoma in patients younger than 20 years is less than 5%. Chondrosarcoma mainly affects the cartilage of arms, ribs, pelvis, and scapula and rarely found in trachea, breast and other parts of the body showing presence of cartilage tissue. Chondrosarcoma patients do not show any symptoms at an early stage hence, it can only be diagnosed in the late stage of a tumor when it shows fracture and bony bump at the tumor site. Diagnosis of chondrosarcoma can be done using radiography (X-Ray), computerized tomography (CT scan) or magnetic resonance imaging (MRI). Unlike other cancers chondrosarcoma is resistant to chemotherapy and radiation therapy and can primarily be treated with surgery. Surgical procedures for chondrosarcoma treatment involve limb sparing operations, complete surgical ablation and amputation in certain cases.
