Abstracts

The global Chopped Graphitized Carbon Fiber market size is expected to reach \$ 111 million by 2032, rising at a market growth of 7.3% CAGR during the forecast period (2026-2032).

Chopped Graphitized Carbon Fiber refers to short, discrete fiber segments obtained by precision cutting graphitized carbon fiber tow or high graphitization carbon fibers, most commonly pitch based high modulus or high thermal conductivity grades. It retains the low density, high stiffness, electrical conductivity, thermal conductivity and low coefficient of thermal expansion associated with graphite or highly graphitized carbon fibers, while its short length allows it to be dispersed into polymer, rubber, metal, carbon graphite, cementitious and other matrix systems as a reinforcing or functional filler.

The upstream raw materials of Chopped Graphitized Carbon Fiber mainly include continuous carbon fiber tow, graphitized pitch based carbon fiber tow, PAN based carbon fiber tow that can be further carbonized or graphitized, petroleum pitch, coal tar pitch, acrylonitrile based PAN precursor, and surface treatment or sizing chemicals used to improve compatibility with target matrices.

In 2025, global sales of Chopped Graphitized Carbon Fiber reached approximately 806 tons, with an average global market price of around US\$ 81/kg. Production capacity varies significantly among manufacturers, with gross profit margins ranging from approximately 30% to 60%.
