The global Chromate-free Electrogalvanized Steel Sheet market size is expected to reach \$ 41887 million by 2032, rising at a market growth of 4.4% CAGR during the forecast period (2026-2032).

Chromate-free electrogalvanized steel sheet refers to a cold-rolled steel substrate coated with a zinc layer through an electrogalvanizing process, followed by a post-treatment that does not use hexavalent chromium (Cr⁶⁺) or traditional chromate-based passivation. Instead, environmentally friendly conversion coatings such as zirconium-based, titanium-based, silicate-based, or organic-inorganic hybrid films are applied to achieve corrosion resistance and surface protection. This material is designed to comply with environmental regulations such as RoHS and REACH, and is widely used in automotive panels, home appliances, and electronic housings where both corrosion resistance and environmental safety are required.

In 2025, global production of chromate-free electrogalvanized steel sheet is 25 million tons, with an average price of around \$1,200 per ton. Compared with conventional electrogalvanized steel, the price premium is relatively limited; however, within automotive certification systems, it can enable a gross margin level of approximately 12-25%.
