The global Chrome Plated Bar market size is expected to reach \$ 1019.4 million by 2029, rising at a market growth of 6.2% CAGR during the forecast period (2023-2029).

The chrome-plated bar refers to the rod that is electroplated on the surface of the hard optical axis to form a layer of chromium with a hardness of 50-60. Because the surface of the chrome-plated rod is plated with a layer of chrome, the chrome-plated bar is widely used in the electroplating industry. The chrome-plated layer has a high hardness. Change within a wide range of 400 ~ 1200HV. The chrome-plated layer has good heat resistance. When heated below 500°C, its gloss and hardness will not change significantly. When the temperature is higher than 500°C, it will start to oxidize and change color, and the hardness will begin to decrease when the temperature is higher than 700°C. Due to the excellent performance of the chromium plating layer, it is widely used as the outer layer and functional coating of the protective coating system.
