Abstracts

According to our (Global Info Research) latest study, the global Chromium Gut Sutures market size was valued at US\$ 277 million in 2025 and is forecast to a readjusted size of US\$ 364 million by 2032 with a CAGR of 4.0% during review period.

In 2025, global sales of chromium gut sutures reached 112 million units, with an average selling price of US\$2.4 per unit. Chromium gut sutures are a type of natural absorbable suture made from the purified mucosa layer of sheep intestines through fiber rearrangement and chromium salt treatment. They possess good tissue compatibility, softness, and a moderate absorption period (generally 10-20 days), and are primarily used in low-tension areas such as skin, small wounds, oral cavity, gastrointestinal tract, and gynecological surgeries. Global total production capacity is approximately 150 million units per year, with an average gross profit margin between 32% and 38%. Upstream raw materials include sheep intestine skin, chromium salts, glycerin, and medical packaging materials, with major suppliers concentrated in India, Pakistan, and China. Future development opportunities lie in improving product consistency, developing antibacterial chromium gut sutures, enhancing supply chain automation, and expanding into incremental markets such as Africa, Southeast Asia, and South Asia.

From a demand and business opportunity perspective, although chromium gut sutures belong to a traditional category, they still possess strong fundamental demand. Its advantages include low cost, moderate absorption time, and good handling, making it suitable for a large number of primary care and small-to-medium-sized surgical procedures. The increasing number of surgeries in developing countries (especially cesarean sections, appendectomies, and small-incision sutures) will be the main source

of growth. Furthermore, natural sutures still have unique applicability in some sensitive tissues (such as the oral cavity and pediatric patients), keeping demand stable. While the supply of upstream intestinal lining resources is subject to minor fluctuations, it will not limit overall market expansion. Key opportunities for companies lie in: regional expansion + product upgrades (antibacterial, low-reactivity) + automation to reduce costs + establishing long-term supply relationships with hospital procurement alliances. Overall, although the industry is not experiencing high-speed growth, it possesses stable, highly sticky, and low-substitution-risk robust market characteristics.

Chromium catgut sutures occupy a position of 'stable demand, limited innovation' in the current absorbable suture market, but still possess long-term viability. Their core value lies in low cost, good tissue compatibility, and a moderate absorption period, making them particularly suitable for low-tension surgical scenarios such as primary care hospitals, small wound suturing, dentistry, general surgery, and obstetrics and gynecology. Although synthetic absorbable sutures (such as PGA, PDO, and PGLA) are gaining increasing market share in high-end medical institutions, they have not completely replaced chromium catgut sutures in the vast mid-to-low-end medical market. Reasons include significant cost differences, equipment and training limitations, and the fact that developing countries' healthcare systems still rely heavily on traditional sutures. Therefore, demand for this category remains robust in the short term.

From an industry competition perspective, the market exhibits a 'centralized raw material + decentralized manufacturing' pattern. Upstream sheep intestine supply is highly dependent on a few regions such as India and Pakistan, making the consistency of raw material quality crucial for company competitiveness. Midstream production has moderate technological barriers, but differences in product consistency, sterilization processes, and packaging standardization result in quality gradients between brands. Downstream hospital procurement tends towards centralized bidding, making economies of scale and cost control important competitive factors.

Future growth will mainly come from three aspects: (1) increased surgical volume in emerging markets (Southeast Asia, South Asia, and Africa); (2) upgrading and iteration of antibacterial and low-tissue-reactivity natural sutures; and (3) automation in manufacturing to reduce costs and improve consistency. Overall, although chromium intestinal sutures are not a high-growth sector, they have rigid demand, low substitution risk, and stable cash flow, making them a mature sub-category with long-term value in the medical consumables field.
