## Abstracts

According to our (Global Info Research) latest study, the global Cinchonidine market size was valued at US\$ 20.37 million in 2025 and is forecast to a readjusted size of US\$ 22.66 million by 2032 with a CAGR of 1.4% during review period.

Cinchonidine is a natural quinoline alkaloid extracted from the bark of *Cinchona* spp. (family Rubiaceae). It possesses stable chiral optical activity and appears as white needle-like crystals. In its free alkaline state, it is slightly soluble in water and readily soluble in organic solvents such as ethanol and chloroform. It can be converted into more water-soluble derivatives such as hydrochloride and sulfate through acid-based salt formation. This substance is not only an important component of traditional antimalarial drugs, exerting its antimalarial effect by interfering with the nucleic acid metabolism of *Plasmodium*, but also, due to its unique chiral configuration, has become a classic chiral resolving agent and asymmetric catalytic ligand in organic synthesis, widely used in the separation of chiral compounds and the synthesis of chiral drug intermediates.

Global production of cinchonidine was 22 tons in 2025, with an average price of \$900/kg.

The upstream of cinchonidine mainly includes natural biological resources such as cinchona bark, solvents, basic chemical reagents, and related extraction and separation auxiliary materials. Downstream applications are the core of demand, primarily concentrated in the pharmaceutical and fine chemical industries. In pharmaceuticals, it is used for chiral resolution and as an important chiral intermediate in the synthesis of certain drugs; in scientific research and pharmaceutical R&D, it is used as an asymmetric catalysis and analytical reagent; and in some fine chemical and chemical reagent markets, it serves as a high-value-added functional raw material. Downstream

customers are more concerned with optical purity, batch stability, compliance, and long-term supply capabilities.

The industry development trend is reflected in the increasing demand for high-purity and high optical selectivity products, with applications gradually concentrating on high-end generic drugs, innovative drugs, and precision synthesis. The growing demand for chiral drugs in the pharmaceutical industry and advancements in green synthesis and efficient separation technologies are the main driving factors. Obstacles include the significant impact of climate and planting cycles on the supply of natural raw materials, high extraction and purification costs, potential substitution pressure from technological advancements in synthetic alternatives, and stringent regulatory and certification requirements for pharmaceutical-grade products.

From a profitability perspective, cinchonidine is a niche high-value-added chemical with a relatively high overall gross profit margin. The gross profit margin of industrial-grade and reagent-grade products is typically between 40% and 55%, while the gross profit margin of high-purity, pharmaceutical-grade, or chiral-grade products can reach 60% to 75%. However, profits are sensitive to fluctuations in raw material prices and economies of scale.
