LED lighting substrate is a basic material used to support and connect LED chips. It not only provides physical support, but also has an important thermal conductivity function to help LED chips dissipate heat, maintain them within the appropriate operating temperature range, and prevent overheating from causing performance degradation or shortened life. At the same time, the substrate also plays the role of electrical connection, ensuring that the current can be effectively transmitted to the LED chip to ensure its normal operation. Common LED substrate materials include FR-4 (glass fiber epoxy board), aluminum substrate and copper substrate, each with different heat dissipation performance and application scenarios.
