Abstracts

According to our (Global Info Research) latest study, the global Circular RNA Sequencing market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Circular RNA (circRNA) has a closed circular structure and is a hot spot of recent research. It exists in large quantities in the cytoplasm of eukaryotic cells, and is mainly produced by pre-mRNA through variable shear processing, and is not affected by RNA exonucleases. The expression is more stable and not easy to degrade. Recent studies have shown that circRNAs have important regulatory functions. For example, circRNAs can play a competitive endogenous RNA (ceRNA) mechanism. Because their molecules are rich in microRNA (miRNA) binding sites, they act as miRNA sponges in cells. Release the inhibitory effect of miRNA on its target gene and increase the expression level of target gene. Especially through the interaction with disease-associated miRNAs, studies have shown that circRNAs can affect the proliferation, invasion and metastasis, angiogenesis and apoptosis of cancer cells. In addition, circRNA also has the functions of regulating other types of RNA and regulating protein activity. These characteristics make circRNA have the potential to develop new diagnosis and treatment methods for diseases, and the research significance is great. The main application areas of circRNA sequencing include research on the pathogenesis of diseases such as tumors; changes in the regulation of gene expression during growth and development; other research directions concerned with the regulation of gene transcription and expression.
