According to our (Global Info Research) latest study, the global Circulating Tumor Cell Detection System market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Research shows that when cancer metastasizes, tumor cells can escape from the primary tumor and enter the patient's peripheral blood to form so-called circulating tumor cells (CTCs). When they metastasize to the stromal microenvironment formed by appropriate organs or tissues, new tumors may form. The tumor cells released when solid tumors or lesions metastasize are an important cause of postoperative recurrence and distant metastasis in patients with malignant tumors, and are also an important factor leading to the death of tumor patients. Currently, they have been confirmed by research to include breast cancer and lung cancer. Diagnostic and prognostic markers for various cancers, including pancreatic cancer, colorectal cancer, etc. Therefore, if circulating tumor cells can be quickly detected in the blood and their number, type and characteristics can be assessed, it will help monitor tumor recurrence, evaluate drug efficacy, assist treatment decisions and adjust treatment plans, and provide better treatment for patients. Treatment and Care.
