Abstracts

The tumor cells which have shed into lymphatic system and circulated over the body through blood circulation are called as circulating tumor cells. Circulating tumor cells may comprise seeds for metastasis. Stem cells are the type of cells that can differentiate into specialized cells and have the capacity of self-renewal. Cancer stem cells are the cancer cells that possess the characteristics of normal stem cells. Cancer stem cells are said to be responsible for relapse of cancers in patients. There is a growing interest in these two cell types due to their fundamental biological and clinical implications. Circulating tumor cells and cancer stem cells are an important element in order to understand cancer related mechanism and to find a cure from all type of cancers. These cells can be used for detecting of metastasis and the patients who are at a higher risk of cancer relapse.
