Abstracts

Circulator Pump is a pump designed to circulate a fluid through a closed system. A closed system is one which runs in a loop, with the pump discharge line eventually returning back to the pump suction, often without ever being exposed to atmospheric pressure. They are generally considered centrifugal pumps, although there are also a few types that use positive displacement technology.

Circulator pumps are commonly utilized for circulating water in a hydronic heating or cooling system. Circulator pumps are basically electrically powered centrifugal pumps that are widely used in hydronic applications. Circulator pumps are commonly used for heating and air conditioning purposes in primarily domestic houses, office buildings, airports and hotels. The pumps that are used in homes are generally small and enclosed in a single housing and usually rated in fractional horsepower. However, the ones that are used in commercial applications are large in size and rate to integral horsepower. These pumps are generally separated from the electrical motor housing as is the case with general industrial pumps.

This report mainly covers the Circulator Pumps product type, while we can also offer any product survey report related to the Circulator Pumps industry chain.
