Circumfluent Cyclone Separator is a type of industrial equipment used for separating solid particles from a gas or liquid stream. It works by creating a vortex that causes the denser particles to move towards the outer edges of the separator, where they are collected and removed.

The separator consists of a cylindrical body with a tangential inlet and a central outlet. The gas or liquid stream enters the separator through the tangential inlet, which creates a high-velocity spiral flow that moves towards the center of the cylinder. As the flow spirals towards the center, the centrifugal force causes the denser particles to move towards the outer edges of the cylinder, where they are collected and removed through an outlet.

Circumfluent circulation cyclone separators are commonly used in industries such as oil and gas, chemical processing, and power generation, where they are used for a variety of applications such as dust and particle removal, gas and liquid separation, and product recovery.
