## Abstracts

According to our (Global Info Research) latest study, the global Cis-Cyclobutane market size was valued at US\$ 60.71 million in 2025 and is forecast to a readjusted size of US\$ 78.10 million by 2032 with a CAGR of 3.7% during review period.

Cis-Cyclobutane is a stereochemical form of cyclobutane derivatives in which substituent groups on the four-membered ring are oriented on the same side of the ring plane, creating distinct physical, chemical, and reactivity properties compared with trans isomers; it is typically encountered in substituted cyclobutane compounds used as intermediates in pharmaceuticals, agrochemicals, and specialty organic synthesis rather than as a bulk commodity molecule. The supply chain begins with upstream petrochemical or bio-based feedstocks (e.g., ethylene, butadiene, or functionalized olefins), followed by midstream synthesis via cycloaddition reactions (such as [2+2] photochemical cyclization or catalytic ring formation) and stereoselective processes to control cis configuration, often requiring advanced organic synthesis, purification (distillation, crystallization, chromatography), and isomer separation technologies. Downstream, cis-cyclobutane derivatives are formulated into high-value applications including active pharmaceutical ingredients (APIs), fine chemicals, and specialty materials, with distribution typically handled by specialty chemical manufacturers and custom synthesis providers rather than large-scale commodity chemical suppliers. In 2025, global Cis-Cyclobutane output was about 5,500 tons with 8,500 tons of capacity, average prices of USD 8,000–18,000 per ton, and gross margins around 33%.
