## Abstracts

The global City Gas Emission Monitoring System market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

City Gas Emission Monitoring System is a system that measures and reports the greenhouse gas (GHG) emissions of a city or a community. It can help cities to identify the sources and sectors of their emissions, track their progress towards emission reduction targets, and develop effective climate action plans.

There are different methods and tools for developing a City Gas Emission Monitoring System, but one of the most widely used and accepted standards is the Global Protocol for Community-Scale Greenhouse Gas Inventories (GPC). The GPC provides a robust framework for accounting and reporting city-wide GHG emissions, following internationally recognized principles and best practices. The GPC covers emissions from stationary energy, transportation, waste, industrial processes and product use, and agriculture, forestry and other land use.

Another type of City Gas Emission Monitoring System is a Continuous Emission Monitoring System (CEMS), which is the total equipment necessary for the determination of a gas or particulate matter concentration or emission rate using pollutant analyzer measurements and a conversion equation, graph, or computer program. CEMS are required under some of the EPA regulations for either continual compliance determinations or determination of exceedances of the standards.

This report studies the global City Gas Emission Monitoring System production, demand, key manufacturers, and key regions.
