## Abstracts

According to our (Global Info Research) latest study, the global Class D Audio Amplifier market size was valued at USD 761.9 million in 2023 and is forecast to a readjusted size of USD 1219.3 million by 2030 with a CAGR of 6.9% during review period.

An audio amplifier is an electronic device that increases the strength (amplitude) of audio signals that pass through it. An audio amplifier amplifies low-power audio signals to a level which is suitable for driving loudspeakers. The input signal of an audio amplifier may only measure a few hundred microwatts, but its output may be tens or even thousands of watts. Design parameters for audio amplifiers include gain, frequency response, distortion and noise.

In a conventional transistor amplifier, the output stage contains transistors that supply the instantaneous continuous output current. The many possible implementations for audio systems include Classes A, AB, and B. Compared with Class D designs, the output-stage power dissipation is large in even the most efficient linear output stages. This difference gives Class D significant advantages in many applications because the lower power dissipation produces less heat, saves circuit board space and cost, and extends battery life in portable systems.

Global key players of class d audio amplifier include Cirrus Logic, Analog Device, Texas Instruments, Renesas (Dialog Semiconductor), etc. Global top five manufacturers hold a share over 60%. In terms of product, mono channel is the largest segment, with a share over 48%. And in terms of application, the largest application is mobile devices, with a share over 26%.
