Abstracts

A class-D amplifier or switching amplifier is an electronic amplifier in which the amplifying devices (transistors, usually MOSFETs) operate as electronic switches, and not as linear gain devices as in other amplifiers. They are rapidly switching back and forth between the supply rails, being fed by a modulator using pulse width, pulse density, or related techniques to encode the audio input into a pulse train. The audio escapes through a simple low-pass filter into the loudspeaker. The high-frequency pulses, which can be as high as 6 MHz, are blocked. Since the pairs of output transistors are never conducting at the same time, there is no other path for current flow apart from the low-pass filter/loudspeaker. For this reason, efficiency can exceed 90%.

Scope of the Report

This report focuses on the Class D Audio Amplifier in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application.

The market for 2-channel Class D audio amplifier is expected to grow at the highest CAGR between 2017 and 2023. 2-channel amplifiers are used in basic car stereo systems to power left and right front stereo speakers and matching rear speakers. Apart from this, they are also used in home entertainment systems and consumer electronic devices.

The Class D audio amplifier market for the multimedia sound case is expected to grow at the highest rate during the forecast period. The growing need for portable speakers which incorporate Class D audio amplifiers is expected to drive the demand for multimedia sound cases during the forecast period.

The worldwide market for Class D Audio Amplifier is expected to grow at a CAGR of roughly 17.4% over the next five years, will reach 7230 million US\$ in 2023, from 2760
