Abstracts

According to our (Global Info Research) latest study, the global Clean Room System Integration Solutions market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Cleanroom system integration is achieved by integrating and coordinating dozens of systems, including cleanroom systems and cleanroom process systems, to form an effective whole. This enables the systems to work together in a coordinated manner, maximize overall efficiency, and maintain cleanroom performance within a controlled environment, ultimately achieving a state where equipment can be moved in.

Cleanrooms are widely used in the semiconductor, optoelectronics, and advanced display industries. Cleanroom engineering can be mainly divided into two categories: industrial cleanrooms and biological cleanrooms. Industrial cleanrooms are mainly applicable to industries such as IC semiconductors, photovoltaics, optoelectronics, aerospace, and nuclear energy, while biological cleanrooms are suitable for pharmaceutical industry, hospitals (operating rooms, sterile wards), food and beverage production, animal laboratories, physical and chemical laboratories, blood stations, etc.

The differences between the two types of cleanrooms mainly lie in their control objectives, which are respectively non-living particles (airborne dust particles, suspended gas molecules) and living particles (bacteria, microorganisms). Different application scenarios have vastly different requirements for the complexity and difficulty of cleanroom engineering construction. For example, the pharmaceutical industry requires higher environmental control of living particles than the food and beverage

production industry, hence the standards for constructing cleanrooms are relatively more stringent.
