According to our (Global Info Research) latest study, the global Cleaning Basket market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

The general method for semiconductor slot cleaning is to first place the wafer in a cleaning basket, and then put the cleaning basket containing the wafer into the cleaning slot. The cleaning slot is equipped with cleaning agent and ultrasonic generation device. Due to the fact that cleaning the flower basket requires contact with the medicinal solution, it is necessary to consider its acid and alkaline resistance, so materials with stable chemical properties are preferred. In addition, due to the need for the flower basket to come into contact with the chip, a smooth surface material is required to avoid damaging the chip. At the same time, in order to meet effective support and clamping, it is also necessary to consider its sufficient rigidity and not easy to deform. The components of the flower basket can be made of the same material to avoid corrosion by acid and alkali media during use, which can cause secondary pollution. According to different requirements, it can be made of fluoroplastics (PTFE, PVDF, PFA) or polypropylene (PP) materials. Fluorine plastic cleaning flower baskets can be used to immerse them in organic or inorganic cleaning agents for cleaning. When the cleaning agent is organic and the temperature is below 80 °C, the material used for cleaning flower baskets can be polypropylene. In addition, there are manufacturers of cleaning flower baskets that perform surface treatment on the materials, enabling the cleaning of flower baskets to quickly remove moisture, achieving quick drying and energy-saving effects. In addition to material requirements, there are also high structural requirements for cleaning flower baskets. The cleaning basket is equipped with cleaning holes and

slots to enhance the cleaning, draining, and drying effects. The compact structure, stable and reliable cleaning and drying process can reduce chip fragmentation rate, while also ensuring that semiconductor chips can fully contact the cleaning agent.
