A cleaning indicator is a tool or product used to monitor and assess the effectiveness of cleaning processes in various industries, particularly in environments where contamination control is critical, such as in pharmaceuticals, food manufacturing, and medical device production. These indicators typically work by providing a visual or measurable change when exposed to specific cleaning conditions or contaminants. They can come in the form of chemical indicators, which change color to show whether cleaning agents have been properly applied or removed, or biological indicators, which use microorganisms to verify that cleaning procedures have sufficiently eliminated harmful pathogens. Cleaning indicators are essential for validating cleaning protocols, ensuring compliance with regulatory standards, and preventing cross-contamination or product contamination. They are often used as part of a broader cleaning validation process to ensure that cleaning procedures consistently meet safety and quality standards.
