## **Abstracts**

According to our (Global Info Research) latest study, the global Cleanliness Testing Microscope market size was valued at US\$ 319 million in 2025 and is forecast to a readjusted size of US\$ 422 million by 2032 with a CAGR of 4.2% during review period.

In 2025, the global production of cleanliness inspection microscopes reached 4,465 units, with an average price of approximately US\$69,400 per unit. The global annual production capacity of cleanliness inspection microscopes was approximately 6,350 units, with a gross profit margin of approximately 52.5%. A cleanliness inspection microscope is a type of microscopic imaging device used to observe and determine the 'cleanliness level' of material/component surfaces. It typically uses optical magnification (or combined with bright/dark field, polarized light, fluorescence, etc.) to magnify and display surface particles, stains, foreign objects, dust/debris, residues, etc., and then combines this with quantitative or semi-quantitative methods to complete the assessment. Common applications include: particle inspection in semiconductor and electronics manufacturing, surface cleanliness verification of medical devices/precision parts, and cleaning quality inspection of automotive and aerospace parts. Compared to ordinary magnifying glasses, it places greater emphasis on stable imaging, repeatable testing, and compatibility with testing standards/procedures (such as setting magnification, lighting conditions, image comparison, and statistical analysis). The upstream of cleanliness inspection microscopes includes objectives, CCD/CMOS sensors and motorized stages, the midstream consists of cleanliness inspection microscope manufacturers, and the downstream is mainly used in industries such as automotive and transportation, aerospace and defense, and medical and life sciences.
