Abstracts

The global Closed Aquaculture System market size is expected to reach \$ 2923 million by 2032, rising at a market growth of 6.6% CAGR during the forecast period (2026-2032).

Closed Aquaculture System is an intensive farming model that completely isolates the farming environment from the external natural water body through physical barriers (such as buildings, enclosures or water isolation devices), and relies on mechanical filtration, biological purification, water quality regulation and circulating water treatment technology to achieve internal recycling of the farming water body. Its core features include zero or very low water discharge, high farming density, strong environmental controllability, and through precise feeding, dynamic water quality monitoring and efficient waste recycling technology, it can significantly improve resource utilization, reduce environmental load, and ensure the healthy growth of farmed organisms. It is suitable for factory farming of high value-added varieties, but it requires high technical investment and energy consumption to maintain stable operation of the system.

This report studies the global Closed Aquaculture System demand, key companies, and key regions.
