The global Closed Mechanical Press market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

A closed mechanical press is a mechanical device used to process metal, plastic or other materials. Its working principle is to place the workpiece in a closed pressure space through mechanical force and apply pressure to change the shape or properties of the workpiece. This type of press has an enclosed working space, providing greater work safety and control compared to open presses. A closed mechanical press usually consists of a frame, a pressure mechanism, a transmission system, a control system and other components. When working, the workpiece is placed in the mold under the pressure mechanism, and then pressure is applied through the transmission system, causing the mold to perform processing operations such as pressing, stamping or forming on the workpiece. Control systems can be used to adjust pressure, time and other processing parameters to ensure processing quality and safety. Closed mechanical presses are widely used in metal processing, plastic molding, stamping molding, mold manufacturing and other fields. They are one of the common and important equipment in industrial production.
